TradeZella → SmartTraderAI (STB) Import Tool

Automates converting a TradeZella CSV export into the STB Bulk Import format. **Default behavior: writes directly to your Google Sheet.** Falls back to `.xlsx` if Google credentials are not yet configured.

> **Note on TradeZella export filenames:** TradeZella names exports using a timestamp, e.g. `trades_20260218124033.csv`. The script accepts any `trades_*.csv` filename — no renaming needed before running it.

📁 Files in This Package

File	Purpose
`tradezella_to_stb.py`	Core Python script — works on Windows & Mac
`automator_drop_handler.sh`	macOS Automator drag-and-drop app script
`STB_Import_Template.xlsx`	STB import template — keep in same folder
`service_account.json`	*(you create this)* Google Cloud credentials

📂 Step 0 — Create Your Working Folder

> **Optional but recommended.** Keeps all files in one place. If you prefer to organise files your own way, just make sure `tradezella_to_stb.py`, `STB_Import_Template.xlsx`, and `service_account.json` are always in the same folder.

🍎 Mac

Open **Terminal** (Spotlight → type "Terminal" → Enter) and run:

```
mkdir -p ~/TradeZella_STB
```

Move your downloaded files in:

```
mv ~/Downloads/tradezella_to_stb.py ~/TradeZella_STB/
mv ~/Downloads/automator_drop_handler.sh ~/TradeZella_STB/
mv ~/Downloads/STB_Import_Template.xlsx ~/TradeZella_STB/
```

Verify everything is there:

```
ls ~/TradeZella_STB/
```

🪟 Windows

Open **Command Prompt** (Windows + R → type cmd → Enter):

```
mkdir %USERPROFILE%\TradeZella_STB
```

Move files in (or drag them in File Explorer):

```
move %USERPROFILE%\Downloads\tradezella_to_stb.py ^
     %USERPROFILE%\TradeZella_STB\
move %USERPROFILE%\Downloads\STB_Import_Template.xlsx ^
     %USERPROFILE%\TradeZella_STB\
```

Verify:

```
dir %USERPROFILE%\TradeZella_STB\
```

🐍 Install Python Packages — One Time Only

These four packages are required. The install method differs slightly depending on your setup.

🍎 Mac — Using a Virtual Environment (Recommended)

Modern macOS with Homebrew protects the system Python from global package installs. The solution is a **virtual environment** — a self-contained Python space just for this project. You only do this once.

```
cd ~/TradeZella_STB
python3 -m venv venv
source venv/bin/activate
pip install pandas openpyxl gspread google-auth
```

Your terminal prompt will show `(venv)` when the environment is active.

Every time you open a new Terminal window to run the script manually, reactivate it first:

```
cd ~/TradeZella_STB
source venv/bin/activate
```

> The Automator app handles this automatically — you never need to activate the venv manually when using drag-and-drop.

🍎 Mac — Using Homebrew (Recommended if you have Homebrew)

Since Homebrew manages its own Python environment, use the `--break-system-packages --user` flags to install safely into your home directory:

```
pip3 install pandas openpyxl gspread google-auth \
  --break-system-packages --user
```

> **Note on PATH warnings:** You may see warnings that scripts were installed to `/Users/yourname/Library/Python/3.x/bin` which is not on PATH. These are safe to ignore — the packages themselves are installed correctly and the script will work fine.

🪟 Windows

```
pip install pandas openpyxl gspread google-auth
```

If `pip` is not found, use:

```
python -m pip install pandas openpyxl gspread google-auth
```

☁️ Google Sheets Setup — One Time Only

This lets the script push trades directly into your live Google Sheet.

Step 1 — Create a Google Cloud Project

1. Go to console.cloud.google.com
2. Click the project dropdown → **"New Project"**
3. Name it (e.g. `TradeZella STB`) → **Create**

Step 2 — Enable the APIs

1. Left sidebar → **"APIs & Services"** → **"Library"**
2. Search **"Google Sheets API"** → **Enable**
3. Search **"Google Drive API"** → **Enable**

Step 3 — Create a Service Account

1. Left sidebar → **"APIs & Services"** → **"Credentials"**
2. **"+ Create Credentials"** → **"Service Account"**
3. Name it (e.g. `stb-importer`) → **Create and Continue** → **Done**
4. Click the service account → **"Keys"** tab
5. **"Add Key"** → **"Create new key"** → **JSON** → **Create**
6. Rename the downloaded file to `service_account.json`
7. Move it into your working folder:

Mac:

```
mv ~/Downloads/service_account.json ~/TradeZella_STB/
```

Windows:

```
move %USERPROFILE%\Downloads\service_account.json ^
     %USERPROFILE%\TradeZella_STB\
```

Step 4 — Share Your Google Sheet

1. Open `service_account.json` in any text editor
2. Copy the `"client_email"` value (looks like `stb-importer@your-project.iam.gserviceaccount.com`)
3. Open your STB Google Sheet → **Share**
4. Paste the email → role **Editor** → **Send**

Step 5 — Add Your Spreadsheet ID

1. Copy the ID from your Google Sheet URL:
   `https://docs.google.com/spreadsheets/d/YOUR_ID_HERE/edit`
2. Open `tradezella_to_stb.py` in any text editor
3. Find this line near the top:

   ```
   SPREADSHEET_ID = "YOUR_SPREADSHEET_ID_HERE"
   ```

4. Replace `YOUR_SPREADSHEET_ID_HERE` with your actual ID (keep the quotes)

🪟 Windows — Daily Use

1. Export trades from TradeZella as `.csv` (any filename is fine)
2. Open Command Prompt in your folder *(File Explorer → click address bar → type `cmd` → Enter)*
3. Run:

   ```
   python tradezella_to_stb.py trades_20260218124033.csv
   ```

   - **Google Sheets configured** → trades append to your live sheet ✅
   - **Not yet configured** → `STB_Import_Merged_YYYYMMDD.xlsx` is created in the same folder — upload it manually

Optional flags

Flag	What it does
`--sheets`	Force Google Sheets output
`--xlsx`	Force .xlsx file output
`--sheet-id YOUR_ID`	Override spreadsheet ID without editing script
`--tab "Sheet1"`	Specify a different tab name
`--output myfile.xlsx`	Custom output filename (xlsx mode)

Optional: One-click `.bat` launcher

Create `run_merge.bat` in your folder:

```
@echo off
cd /d "%~dp0"
python tradezella_to_stb.py %1
pause
```

Drag any CSV onto `run_merge.bat` to run without opening Command Prompt.

🍎 Mac — Daily Use

The **recommended method** is the Automator app — a desktop icon you drag CSV files onto. No Terminal needed after setup.

Method 1: Automator Drag-and-Drop ⭐ Recommended

One-time setup (~5 minutes):

1. Confirm `~/TradeZella_STB/` contains:
    - `tradezella_to_stb.py`
    - `STB_Import_Template.xlsx`
    - `service_account.json` *(after Google Cloud setup)*
    - `venv/` folder *(after Python package install)*
2. Open **Automator** *(Spotlight → "Automator" → Enter)*
3. Choose **"Application"** as the document type
4. Search for **"Run Shell Script"** → drag it into the workflow
5. Set **"Pass input:"** to **`as arguments`** *(critical — this is how the CSV path reaches the script)*
6. Delete all default code in the text box
7. Paste the entire contents of `automator_drop_handler.sh`
8. **File → Save** → name it `TradeZella to STB` → save to **Desktop**

Daily use:

1. Export trades from TradeZella as `.csv`
2. Drag the `.csv` onto **TradeZella to STB** on your Desktop
3. Result:
    - Google Sheets configured → trades appear in your sheet ✅
    - Not configured → `.xlsx` file saved next to your CSV and opens automatically ✅

You can drop multiple CSV files at once.

Method 2: Terminal

```
cd ~/TradeZella_STB
source venv/bin/activate
python3 tradezella_to_stb.py ~/Downloads/trades_20260218124033
```

📋 Column Mapping Reference

TradeZella	→	STB Template	Notes
Open Date	→	Trading Date	
Entry Model	→	Entry Model	Blank → `other (specify)`
(hardcoded)	→	Currency	Always USD
Net P&L	→	Profit / Loss	
Status + Net P&L	→	Outcome	`green` / `red` / `breakeven`
Emotions	→	Emotions	Multi-select, passed through as-is
Did Emotions Affect Decisions?	→	Did emotions affect decisions?	yes / no
Was Emotionally Stable?	→	Was emotionally stable?	yes / no
Profit Target Did You Respect It?	→	Profit target - did you respect it?	
Stop Loss Did You Respect It?	→	Stop loss - did you respect it?	
Entry Logic Explanation	→	Entry logic explanation	
How Did The Trade Play Out?	→	How did the trade play out?	
Notes For Coaches	→	Notes for coaches	
(not in TradeZella)	→	Screenshot URLs	Left blank

🆘 Troubleshooting

Problem	Fix
`ModuleNotFoundError: pandas`	Run the venv setup steps in the Python install section
`externally-managed-environment`	Use the virtual environment method — see Python install section
`SPREADSHEET_ID is not set`	Edit `SPREADSHEET_ID` at the top of `tradezella_to_stb.py`
`service_account.json not found`	Move it into the same folder as the script
`403 PERMISSION_DENIED`	Share the Google Sheet with the `client_email` from your JSON (Editor)
`gspread.exceptions.APIError`	Enable both Sheets API and Drive API in Google Cloud Console
Automator does nothing	Check **"Pass input: as arguments"** is set in the workflow
Automator can't find Python	Run `which python3` in Terminal and update `SCRIPT_DIR` in the Automator script
Python not found on Mac	Install from python.org or `brew install python3`
Template not found	Confirm `STB_Import_Template.xlsx` is in the same folder as the script
